PRODUCTIVITY AND COSTS

Fourth Quarter and Annual Averages 2025, Revised

Nonfarm business sector labor productivity increased 1.8 percent in the fourth quarter of 2025, the U.S. Bureau of Labor Statistics reported today, as output increased 1.5 percent and hours worked decreased 0.2 percent. (All quarterly percent changes in this release are seasonally adjusted annualized rates.) From fourth-quarter 2024 to fourth-quarter 2025, nonfarm business sector labor productivity increased 2.5 percent. (See chart 1 and table A1.) Annual average productivity increased 2.1 percent from 2024 to 2025. (See table C1.)

Chart 1. Labor productivity, nonfarm business, 2021Q1 – 2025Q4

Chart 2. Unit labor costs, nonfarm business, 2021Q1 – 2025Q4

Unit labor costs in the nonfarm business sector increased 4.4 percent in the fourth quarter of 2025, reflecting a 6.3-percent increase in hourly compensation and a 1.8-percent increase in productivity. Unit labor costs increased 2.4 percent over the last four quarters. (See chart 2 and tables A1 and 2.)

BLS calculates unit labor costs as the ratio of hourly compensation to labor productivity. Increases in hourly compensation tend to increase unit labor costs and increases in productivity tend to reduce them. Real hourly compensation, which takes into account consumer prices, increased 3.7 percent in the fourth quarter of 2025, and increased 2.1 percent over the last four quarters. The labor share, which is the percentage of output that accrues to workers in the form of compensation, was 54.4 percent in the fourth quarter of 2025.

Labor productivity, or output per hour, is calculated by dividing an index of real output by an index of hours worked by all workers, including employees, proprietors, and unpaid family workers. During the

current business cycle, starting in the fourth quarter of 2019, labor productivity has grown at an annualized rate of 2.1 percent, reflecting a 2.6-percent rate of growth in output and a 0.4-percent rate of growth in hours worked. (See chart 3.) The 2.1-percent annualized rate of nonfarm business productivity growth in the current business cycle thus far is higher than the 1.5-percent rate of the previous business cycle, from the fourth quarter of 2007 through the fourth quarter of 2019, and slightly lower than the long-term rate of 2.2 percent since the first quarter of 1947.

Chart 3. Labor Productivity, Output, and Hours Worked index series, nonfarm business, 2019 Q4 – 2025 Q4

Manufacturing sector labor productivity decreased 2.5 percent in the fourth quarter of 2025, as output decreased 2.8 percent and hours worked decreased 0.3 percent. In the durable manufacturing sector, productivity decreased 3.3 percent, reflecting a 2.6-percent decrease in output and a 0.7-percent increase in hours worked. Nondurable manufacturing sector productivity decreased 1.2 percent, as output decreased 3.1 percent and hours worked decreased 1.9 percent. Total manufacturing sector productivity increased 2.1 percent from the same quarter a year ago. (See tables A1, 3, 4, and 5.)

Unit labor costs in the total manufacturing sector increased 9.1 percent in the fourth quarter of 2025, reflecting a 6.3-percent increase in hourly compensation and a 2.5-percent decrease in productivity. This is the largest increase in manufacturing unit labor costs since the third quarter of 2022, when the measure increased 11.4 percent. Manufacturing unit labor costs increased 2.9 percent from the same quarter a year ago. (See tables A1 and 3.)

Manufacturing sector labor productivity has grown at an annualized rate of 0.4 percent during the current business cycle, as output is unchanged and hours have declined 0.4 percent. (See chart 4.) The 0.4-percent annualized rate of productivity growth in the current business cycle thus far is above the 0.1-percent rate of the previous business cycle from the fourth quarter of 2007 through the fourth quarter of 2019 and is below the long-term rate of 2.1 percent since the first quarter of 1987.

Chart 4. Labor Productivity, Output, and Hours Worked index series, manufacturing, 2019 Q4 – 2025 Q4

The concepts, sources, and methods used for the manufacturing output series differ from those used in the business and nonfarm business output series; these output measures are not directly comparable. See the Technical Notes for a more detailed explanation. (See page 8.)

Nonfinancial corporate sector labor productivity increased 4.5 percent in the third quarter of 2025, as output increased 5.2 percent and hours worked increased 0.6 percent. Productivity increased 3.8 percent over the last four quarters. Unit labor costs in the nonfinancial corporate sector increased 1.2 percent in the third quarter of 2025, reflecting a 5.8-percent increase in hourly compensation and a 4.5-percent increase in productivity. Unit labor costs increased 1.4 percent over the last four quarters. Unit profits of nonfinancial corporations increased 6.6 percent in the third quarter of 2025 and decreased 0.3 percent in the last four quarters. (See tables A2 and 6.)

Revised measures

The measures released today are based on more recent source data than were available for the preliminary report. Regular updates of source data from BLS, the Bureau of Economic Analysis (BEA) and the Board of Governors of the Federal Reserve System are reflected in data for the third and fourth quarters of 2025.

Table B1 presents revised and previous labor productivity and related measures for the nonfarm business, business, and manufacturing sectors for the fourth quarter of 2025. Table A2 presents revised and previous measures for the nonfinancial corporate sector for the third quarter of 2025.

Nonfarm business sector productivity in the **fourth quarter of 2025** increased 1.8 percent rather than the previous estimate of 2.8 percent, reflecting a 1.1-percentage point downward revision to output; hours worked were not revised. Unit labor costs were revised up 1.6 percentage points to an increase of 4.4 percent, reflecting a 1.0-percentage point downward revision to productivity and a 0.6-percentage point upward revision to hourly compensation. (See table B1.)

Manufacturing sector productivity was revised down 0.6 percentage point to a decrease of 2.5 percent in the **fourth quarter of 2025**, reflecting a 0.6-percentage point downward revision to output. Hours worked were not revised. Productivity was revised down 0.3 percentage point to a decrease of 3.3 percent in the durable manufacturing sector and was revised down 1.0 percentage point to a decrease of 1.2 percent in the nondurable manufacturing sector. (See table B1.)

In the **third quarter of 2025**, nonfarm business unit labor costs were revised up 2.8 percentage points to an increase of 1.0 percent, reflecting a 2.9-percentage point upward revision to hourly compensation. Manufacturing unit labor costs were revised up 0.6 percentage point to an increase of 1.8 percent, reflecting a 0.6-percentage point upward revision to hourly compensation and a 0.1-percentage point downward revision to productivity. (See table B2.)

In the **nonfinancial corporate sector**, productivity was revised up 1.1 percentage point in the **third quarter of 2025** to an increase of 4.5 percent, as output was revised up 1.2 percentage points to an increase of 5.2 percent and hours worked were unrevised. Unit labor costs were revised up 0.9 percentage point, to an increase of 1.2 percent, reflecting a 2.1-percentage point upward revision to hourly compensation and a 1.1-percentage point upward revision to productivity. Unit profits of nonfinancial corporations were revised down 1.2 percentage points, increasing 6.6 percent in the third quarter of 2025. (See tables A2 and 6.)

Annual averages

Table C1 presents **annual average changes** for the most recent 5 years for the nonfarm business sector and the total manufacturing sector. **Nonfarm business sector** productivity was revised down 0.1 percentage point to an increase of 2.1 percent in 2025, as output was revised down 0.1 percentage point to an increase of 2.5 percent. Hours worked in 2025 were unrevised.

Unit labor costs in the nonfarm business sector were revised up 0.4 percentage point to an increase of 2.3 percent in 2025, reflecting an upward revision of 0.4 percentage point in hourly compensation and a 0.1-percentage point downward revision to productivity. Real hourly compensation, which takes into account changes in consumer prices, increased 1.8 percent in 2025.

In the **manufacturing sector**, productivity was revised down 0.1 percentage point to an increase of 1.9 percent in 2025, as output was revised down 0.1 percentage point to an increase of 1.0 percent. Hours worked were unrevised, decreasing 0.9 percent. The 1.9 percent increase in manufacturing productivity in 2025 is the largest annual increase in this measure since 2010, when it increased 6.3 percent.

Manufacturing unit labor costs were revised up 0.1 percentage point to an increase of 2.4 percent in 2025, as hourly compensation was revised up 0.1 percentage point and productivity was revised down 0.1 percentage point. The increase in manufacturing unit labor costs was lower than increases in the previous 3 years, each of which exceeded 4.0 percent. Manufacturing real hourly compensation increased 1.7 percent in 2025.

Quarterly and annual data for all sectors for recent years appear in tables 1-6. Full historical annual and quarterly measures, including percent changes, indexes, and levels, can be found in the file located at www.bls.gov/productivity/tables/labor-productivity-major-sectors.xlsx.

The preliminary Productivity and Costs news release for first-quarter 2026 is scheduled to be released on Thursday, May 7, 2026, at 8:30 a.m. (ET).

Federal Government Shutdown

Publication of this Productivity and Costs Fourth Quarter and Annual Averages 2025, Revised release was delayed due to a lapse in appropriations. Productivity and costs data are not collected directly; rather, they are calculated using source data from other BLS programs and government agencies. Once all required source data became available, data presented in this release were produced.

Table A1. Labor productivity growth and related measures - revised fourth-quarter 2025
(percent change from previous quarter at annual rate and from same quarter a year ago)

Sector	Percent change from:	Labor productivity	Output	Hours worked	Hourly compensation	Real hourly compensation	Unit labor costs

TECHNICAL NOTES

Labor Hours

Hours worked data for the labor productivity and cost measures include hours worked for all persons working in the sector—wage and salary workers, the self-employed and unpaid family workers. The primary source of hours and employment data is the BLS Current Employment Statistics (CES) program, which provides monthly survey data on the number of jobs held by and hours paid to wage and salary workers in nonfarm establishments, counting a person who is employed by two or more establishments at each place of employment. As of the February 3, 2023 Employment Situation release, the CES program has updated the national nonfarm payroll series to the 2022 North American Industry Classification System (NAICS). The BLS Major Sector Productivity program will be remaining on a NAICS 2017 basis for the time being by converting NAICS 2022 data from CES back to a NAICS 2017 basis using ratios published on the CES website and based on the Quarterly Census of Employment and Wages (QCEW). Hours of paid time off are removed from hours paid using data from the National Compensation Survey (NCS) for 1996 forward and data from the BLS Hours at Work survey, conducted for this purpose, prior to 1990. Between 1990 and 1995, hours of paid time off are removed using a combination of NCS and Hours at Work survey data. Off-the-clock hours are added, yielding hours worked, using data from the Current Population Survey (CPS).

Data from the CPS are used to estimate hours worked for farm labor, nonfarm proprietors, and nonfarm unpaid family workers. Using CPS information on employment and hours worked at primary jobs and all other jobs, separately, the BLS productivity measures assign all hours worked to the appropriate industrial sector. Hours for government enterprises are derived from the CPS, the CES, and the National Income and Product Accounts (NIPA) prepared by the Bureau of Economic Analysis (BEA) of the Department of Commerce.

Detailed hours data are presented in the table “Hours Worked in Total U.S. Economy and Subsectors” on the BLS website (www.bls.gov/productivity/tables/total-economy-hours-employment.xlsx).

Output

Business sector output is a chain-type, current-weighted index constructed after excluding from gross domestic product (GDP) the following outputs: general government, nonprofit institutions, and households (including owner-occupied housing). Corresponding exclusions also are made in labor hours worked. Businesses accounted for about 77 percent of the value of nominal GDP in 2025. Nonfarm businesses, which exclude farming, accounted for about 76 percent of nominal GDP in 2025.

Annual indexes for manufacturing and its durable and nondurable goods components are constructed by deflating current-dollar industry value of production data from the U.S. Bureau of the Census with deflators from the BLS. These deflators are based on data from the BLS Producer Price Index program and other sources. The industry shipments are aggregated using annual weights, and intrasectoral transactions are removed. Quarterly manufacturing output measures are based on the indexes of industrial production prepared monthly by the Board of Governors of the Federal Reserve System, adjusted to be consistent with annual indexes of manufacturing sector output prepared by BLS.

Nonfinancial corporate output is a chain-type, current-weighted index calculated on the basis of the costs incurred and the incomes earned from production. The output measure excludes the following outputs from GDP: general government; nonprofit institutions; households; unincorporated business; and those corporations classified as offices of bank holding companies, offices of other holding companies, or offices in the finance and insurance sector. Nonfinancial corporations accounted for about 51 percent of the value of nominal GDP in 2024.

Labor Productivity

The measure describes the relationship between real output and the labor time involved in its production. Measures of labor productivity growth show the changes from period to period in the amount of goods and services produced per hour worked. They reflect the joint effects of many influences, including changes in technology; capital investment; level of output; utilization of capacity, energy, and materials; the organization of production; managerial skills; and the characteristics and effort of the work force.

Labor Compensation

The measure includes accrued wages and salaries, supplements, employer contributions to employee benefit plans, and taxes. Estimates of labor compensation by major sector, required for measures of hourly compensation and unit labor costs, are based primarily on employee compensation data from the NIPA, prepared by the BEA. The compensation of employees in general government, nonprofit institutions and households are subtracted from compensation of employees in domestic industries to derive employee compensation for the business sector. The labor compensation of proprietors cannot be explicitly identified and must be estimated. This is done by assuming that proprietors have the same hourly compensation as employees in the same sector. The quarterly labor productivity and cost measures do not contain estimates of compensation for unpaid family workers.

Unit Labor Costs

These measures describe the relationship between compensation per hour and labor productivity, or real output per hour, and can be used as an indicator of inflationary pressure on producers. Increases in hourly compensation increase unit labor costs; labor productivity increases offset compensation increases and lower unit labor costs.

Presentation of the data

The quarterly data in this release are presented in three ways: as percent changes from the previous quarter presented at a compound annual rate, as percent changes from the corresponding quarter of the previous year, and as index number series where 2017=100. Annual data are presented both as index number series and percent changes from the previous year.

The index numbers and rates of change reported in the productivity and costs news release are rounded to one decimal place. All percent changes in this release and on the BLS web site are calculated using index numbers to three decimal places. A complete historical series of these index numbers are available at the BLS productivity web site, <https://www.bls.gov/productivity/data.htm>, or by contacting the BLS Division of Major Sector Productivity (Telephone 202-691-5606 or email productivity@bls.gov).

For a more detailed explanation of methods see the Handbook of Methods at www.bls.gov/pub/hom/opt/.

March 24, 2026
Source: Bureau of Labor Statistics

SOURCES: Output data are from the Bureau of Economic Analysis and the Census Bureau of the U.S. Department of Commerce; the Bureau of Labor Statistics, U.S. Department of Labor; and the Federal Reserve Board. Hours and compensation data are from the Bureau of Labor Statistics and the Bureau of Economic Analysis.

SIZE OF REVISIONS: Productivity and cost measures are revised on a regular schedule as more complete data become available. The first estimate is published within 40 days of the close of the reference quarter, the second estimate approximately 30 days later, and the third estimate approximately 60 days after the second estimate. Based on past revisions, the third estimate of nonfarm business sector quarterly labor productivity growth has differed from the first estimate by -1.0 to +1.4 percentage point about 80 percent of the time. This interval is based on estimates for reference quarters from the first quarter of 2001 to the third quarter of 2025. For more about revisions to labor productivity growth see “Revisions to BLS quarterly labor productivity estimates: How large are they?” at www.bls.gov/opub/mlr/2022/article/revisions-to-bls-quarterly-labor-productivity-estimates-how-large-are-they.htm.

Table Footnotes

- (1) Wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. Except for nonfinancial corporations, where there are no self-employed, data also include an estimate of wages, salaries, and supplemental payments for the self-employed.
- (2) The change for recent quarters is based on the Consumer Price Index for all urban consumers (CPI-U). The trend from 1978-2024 is based on the Consumer Price Index Retroactive series (CPI-URS).
- (3) Unit nonlabor payments include profits, consumption of fixed capital, taxes on production and imports less subsidies, net interest and miscellaneous payments, business current transfer payments, rental income of persons, and the current surplus of government enterprises.
- (4) Current dollar output divided by the output index.
- (5) Quarterly changes: Percent change compounded at annual rate is calculated using index numbers to three decimal places. Indexes published in the news release are rounded to one decimal place for convenience. Annual changes: Percent change is calculated using annual indexes to three decimal places.
- (6) Unit nonlabor costs include consumption of fixed capital, taxes on production and imports less subsidies, net interest and miscellaneous payments, and business current transfer payments.
- (7) Total unit costs are the sum of unit labor and nonlabor costs.
- (8) Unit profits include corporate profits before tax with inventory valuation and capital consumption adjustment.
